First part: Problem understanding and Data understanding

Apart from general information (your first name, last name, date, report title), your report should contain:

- general description of the data set,
- discussion of data mining goals and success criteria,
- characteristics of the data set (origin, format, number of samples, whether it consists of one set or several),
- description of the attributes (names, types - nominal / numerical, meaning, unit of measurement, special values),
- exploratory data analysis:
    - distribution of attribute values,
    - correlations between attribute values,
    - preliminary findings about the contents of the datasets,
- discussion of data quality:
    - missing data,
    - outliers,
    - overall data integrity,
    - values of unknown meaning
- revision or discussion of validity of goals for further data mining
